Turn of the Century Series
Pressed Metal Designs in Vinyl

INNOVATION OR SYNTHESIS

The ceilings of today should be a decorative component, complementing your planned interiors, creating an exciting completeness.

Cepco "Art Form" vinyl ceilings represent endless design possibilities in ceiling aesthetics. Cepco has recently introduced a uniquely designed system of ceiling panels and components. The "Art Form" series of decorative panels range from the contemporary of the beautifully reflective

"Nebulite" and "Pinwheel" Series
to the unique mixture of period and mood of the
"Old English" Series
to the formal ornamentation of the
"Renaissance" Series
to the Déjà Vu of the
"Turn of the Century" Series.

Cepco is the exclusive manufacturer of "simulated" Pressed Metal Ceiling. Designs of the "Belle Epoque Period" are translated in burnished metals and custom colors. The dimensional effect of our panels must be seen to be appreciated.

Product Information

Cepco Ceiling panels are based on "in-house" special rigid vinyl technology using compounds designed for maximum longevity through the use of ultra-violet protection and very specific long term heat stabilizers.

Crystal Clear

Crystal clarity is obtained by matching the index of refraction of all compounding materials as close as possible, and at the same time maintaining impact strength and other necessary physical properties.

Milk-Glass / Clear Bronze

These shades result from the precise addition of opaque colorants which directly control light transmission.

Opaque

These particular shades are based on inorganic pigments designed for excellent heat and light stability.

Brass / Copper / Pewter

These shades are based on DuPont's pearlescent colorants tinted with stabilized transparent toners.

All ceiling panels are calendered and vacuum-formed with dimensional accuracy for uniform, long lasting elegant service.

Advantages:

1. Good light stability.
2. Vacuum formed into distinctive architectural patterns.
3. Washable.
4. Permits easy installation.

Support System: Suspended ceiling system with exposed tee bar grid by others.

Polyvinyl Chlorides (PVC) is a tough material with built-in flame resistance, which does not support combustion. The present generation of rigid vinyl compounds represents the ultimate in heat and light effectiveness along with fire drop out sprinkler-protected-safety.

Custom Design

Cepco has the technology, the Artisans & the Mold-Making Facilities to translate your ideas into attractive panels and with color know-how to complement your total design.

UL Codes

Cepco panels are tested and classified by UL and may be used beneath sprinklers when installed in accordance with local codes. Cepco panels will not support combustion and qualify as "CLASS I" (Flame Spread Classification) building materials as prescribed in Building Codes.

Cepco panels, UL approved for use under sprinklers, simplify ceiling installation and enhance ceiling appearance. This eliminates the necessity for sprinklers above and below suspended ceilings. In remodeling work, Cepco panels may be installed without the expense of moving or extending existing sprinklers.

Typical UL Listings

1. Nebulite Series and Pinwheel Series Lens
Flame Spread 25,
Smoke Developed 250
2. Wood Grain Series and Turn of the Century Series Panels. (Opaque)
Flame Spread 15,
Smoke Developed 80-140
